Any integrin which contains a phosphorylated tyrosine in the cytoplasmic domain of the β subunit can be used for identifying and isolating an integrin cytoplasmic signaling partner. These particularly include the β 1, β 2, β 3, β 5, β 6, β 7 and β 8 subunits, but other β subunits are contemplated. These particularly exclude β subunits in which the phosphorylated tyrosine is followed by an isoleucine or leucine in an ITAM motif (YXXI/L) (SEQ ID NO. 8).—

--In light of our discovery, the following observations are relevant. The NPLY sequence (SEQ ID NO. 26) encompassing residues 744-747 of GPIHa is homologous to the NPXY motif (SEQ ID NO. 27) which, when phosphorylated on tyrosine, is known to bind proteins with the phosphotyrosine-binding (PTB) domain such as SHC, IRS-1, and possibly pp140 kDa (Kavanaugh, W.M. et al., Science (1994) 266:1862-1865; Gustafson, T.A. et al., Mol. Cell Biol.

--The discovery that the cytoplasmic domain of GPIIIa is phosphorylated at tyrosine residues during platelet aggregation was the first step in demonstrating that the phosphorylated cytoplasmic domain has functional activity in interacting with signaling proteins. A phosphorylated peptide corresponding residues 740-762 of GPIIIa was synthesized and coupled to biotin at the main terminus:
